

Wagura

Balantac, Zeljhay - Developer

Mengote, Nicole - Designer

Quibral, Mark Anthony - Designer

Villafranca, Brent Aldhee - PM & Developer

1. High-Level Definition

- Wagura is a website where pet owners in Laguna can manage and track their dogs' and cats' health through a private personal dashboard. The platform features two panels: a User panel for pet owners to enroll and manage their pets, and an Admin panel for managing articles, daily insights, and platform content. It also includes a public section with guides and tips for local issues like ticks in humid weather or rabies from strays.

2. High-Level Modules

- User Authentication (login and registration for pet owners)
- User Panel - Pet Enrollment and Management
- Admin Panel - Content and User Management
- Daily Pet Insights
- Pet Health Logging System
- Search and Filter System for Articles and Guides
- Public Community Resources Hub
- Database Integration via XAMPP, PHP, and SQL

3. Functional Requirements

- **User Panel**
 - Users can register and log in to their personal account
 - Users can enroll up to 5 pets per account
 - Each pet has a customized profile (unique ID, photo, name, breed, and age)
 - Users can manage their enrolled pets (add, edit, delete)
 - Users can log health entries such as feeding, weight, symptoms, and vet visits
 - Users can read PH-specific guides on humid climate care, rabies prevention, and stray help
 - Users can search and filter articles by category (Dogs, Cats, General) or by specific breed
 - Users can view daily pet insights and did-you-know facts relevant to their pets
- **Admin Panel**
 - Admins have access to a full dashboard with an overview of platform activity

- Admins can create, read, update, and delete (CRUD) articles and guides
- Admins can create and manage daily pet insights shown to users
- Admins can manage enrolled pets and user accounts

4. Non-Functional Requirements

- Page loads in under 3 seconds
- Works on both phones and computers (responsive design)
- Login data is kept secure with basic encryption
- Easy to use for any type of user, including non-tech-savvy pet owners
- Supports up to 100 users for the demo build
- Search and filter system must return accurate and relevant results

5. Scope

- **In scope:** Build a responsive website with a two-panel system (User and Admin). The User panel includes registration, login, pet enrollment (up to 5 pets with custom IDs), pet management, health logging, daily insights, and a searchable public guides section with filtering by category and breed. The Admin panel includes a dashboard and full CRUD access for articles, insights, and pet/user data. A JSON file will be used for data dummies. The tech stack is HTML, CSS, JavaScript, PHP, SQL, and XAMPP. The project focuses on Laguna-specific content like rabies law compliance and humidity care tips.
- **Out of scope:** Real vet bookings, AI symptom checker, mobile app stores, paid features, live chat with vets, PDF export, and progress charts.

6. Constraints

- Time: 1 semester with 4 members (approximately 13 weeks)
- Budget: Zero pesos — all tools and technologies used are free
- Tech stack: HTML, CSS, JavaScript, PHP, SQL, XAMPP (local server)
- Data: JSON file used for data dummies; no real user data collected
- Skills: Team is currently learning web development fundamentals

- Scope is limited to a working prototype that represents a real product
